ANNEXURE: AI USE DECLARATION

NEXORA — Self-Healing Smart City Infrastructure Monitoring System

I used ChatGPT as a helper while planning and developing my project. I asked for explanations, ideas and suggestions, but I reviewed the suggestions and worked on the project myself. The table below explains how I used AI and what I did independently.

AI tool use and my own work

AI tool	What I asked ChatGPT	What I did myself
ChatGPT	I asked for ideas for the dashboard overview, page layout, colours, service cards, dependency map, and ways to show monitoring information clearly. I also asked for frontend design suggestions and explanations of React and CSS when I needed help.	I worked on the frontend files, added and arranged the dashboard sections, connected the pages to the project API, and checked the design in the browser. I chose which suggestions suited my project and changed or removed suggestions that I did not like.
ChatGPT	I asked for explanations and guidance about the backend workflow, including service monitoring, failure types, incident records, recovery steps, and reliability results. I also asked how to explain the project for my submission and demo video.	I worked with the Node.js and Express backend and the MongoDB connection, ran the application locally, and checked the API and dashboard results. I tested the simulated services PowerGrid, AquaFlow, CityLink and MediCore, ran controlled failure tests, checked recovery outcomes and incident history, and tried the CSV data-healing feature. I used the actual results from my project when reviewing what worked.
ChatGPT	I asked for help understanding how to present the dependency map, self-healing pipeline, risk information, and project features in simple English.	I reviewed the displayed information and tested the relevant pages. I decided which design changes to keep, and I am responsible for understanding the code and explaining how the project works.

How much AI did I use?

I used ChatGPT for guidance, explanations, ideas and wording—not as a replacement for checking my project. I cannot give an exact percentage because AI helped with different tasks in different ways. I reviewed the suggestions, made my own choices, ran the project and checked its behaviour. The final code and declaration should reflect the work I actually completed.

My responsibility

I understand that AI suggestions may need changes or may not fit my project. I am responsible for the final submission, and I should be able to explain the frontend, backend, simulated failures, recovery workflow and data-healing feature to my teacher.
